I asked And I've just got a new MacBook... 'Can you get ASIO4ALL on a Mac?' Latency can be all too common of a problem when you are first starting out in your home recording studio. The delay between pressing a note on your keyboard, or strumming a chord on your guitar and the time it takes for the computer to register the signal, can cause havoc when it comes to keeping in time, virtually making recording a track impossible. When I first started making music at home this used to be the thing that frustrated me more than anything! So you google what to do to stop the issue and you keep seeing phrases like; "download 'ASIO4ALL', it will solve all your problems" What is this mystical thing? Well, in short, ASIO4ALL is a hardware independent low latency driver built for Windows operating systems and designed to reduce latency. ASIO4ALL is not available for Mac computers and is only available on Windows. Read on for a bit more information on what exactly this mystical thing is and some other strategies for reducing latency if even the mighty ASIO isn't solving your issues. Latency is becoming less of a problem as computers become more modern and have a higher specification but it can still be an issue for many people and certainly used to be a problem for virtually everyone in a home recording studio had to deal with. This delay from playing a note to it sounding can be anything from milliseconds to entire seconds in some cases. But even a lag of milliseconds is very noticeable and very annoying! Latency comes about because unfortunately computers aren't built specifically to be used for recording audio, they are built as all-around machines that can perform lots of different tasks. For this reason, the built-in sound card and associated drivers aren't up to the job of processing sound quickly enough to avoid noticeable latency. Ok, I will try and keep this as simple and brief as possible, here goes. The sound card within your computer is provided with drivers which enable your audio applications and the sound card to communicate. In most Windows computers up until fairly recently these pre-installed drivers sucked (MME/ Direct X may sound familiar to you) and produced a lot of lag or latency. This made using anything like a MIDI keyboard or recording audio into a DAW very frustrating! This was because the drivers that came in these computers were not designed with music production in mind and were busy trying to do other non-music stuff at the same time.... ruining everything! So the lovely people at Steinberg (the company behind Cubase DAW software) decided enough was enough and they designed a driver that was tailored towards audio production. The ASIO drivers would bypass the windows ones and the problems would be solved. Unfortunately, you still needed professional standard audio cards to use the ASIO drivers, which was great if you were in a professional studio but not great for most of us trying to record music in our bedrooms. So ASIO4ALL was released to do exactly what it says in the name, be a driver for ALL. How it works is not important but it sort of acts as a middleman passing messages between the Windows hardware and ASIO. If you have moved from a PC to a mac you may be expecting latency issues like I was. I don't want to Windows bash here too much, I'm sure they do make some great machines these days. I'm just talking from my experience. I have always needed to download additional drivers on windows PCs to deal with latency even when I thought I had top of the range specifications. Then I got fed up and one day splashed out on a (second hand) MacBook, and I have not had any latency issues since. For this reason, you will not need ASIO4ALL on your Mac. And it is a good job you don't as ASIO4ALL isn't actually 4 ALL, it is only actually 4 Windows. Even on really old macs, you shouldn't really need any additional drivers. Apple computers have excellent built-in audio drivers known as Core Audio which should work just fine. The good news is that hopefully not. Most Windows computers made for Windows 7 and onwards are made with WASAPI. This fun sounding acronym stands for the Windows Audio Session API. It works in a similar way to ASIO by talking to audio devices, bypassing system mixers and allowing direct communication between applications and audio devices. So you should be ok on newer Windows machines but you can still try ASIO4ALL if you are still having latency issues. If that still doesn't help, below are a few more quick fixes for latency that you can try. Get a better audio interface One of the quickest things you can do (if you haven't already) is to buy a decent audio interface. These will act as an external soundcard with specialist drivers built-in. Unlike computer soundcards and drivers, these are designed for this specific purpose. In fact, many audio interfaces actually have ASIO drivers built in. I recommend this interface from Focusrite if you don't already own one. I've had one for a couple of years and never looked back! Check latest price The time that your computer sound card needs to process information is known as the buffer size. If your buffer size is too large you will get latency. So by reducing this buffer size you can reduce this lag, however, beware, the smaller the buffer size the more strain is placed upon your computer and it may cause glitches. So have a play with different buffer sizes and see if it helps. Another setting to fiddle with in your DAW settings is the sample rate. By raising the sample rate you are increasing the number of samples the computer is reading every second. As with a small buffer size the higher the sample rate the harder your computer has to work. Some plugins can put quite a strain on your computers CPU and so if you've recently installed a new one this may be causing the latency issues. I will quickly explain how to get ASIO4ALL working in Ableton but it should be a similar process in other DAWs too. Once you have downloaded ASIO4ALL from here. Head into preferences in Ableton. From here, go to the audio tab on the left and then you will see an option for driver select. This should allow you to select ASIO4ALL as the driver and you are good to go! So to conclude, ASIO4ALL is a handy way to quickly reduce latency issues in your home recording studio. Although it is not so applicable nowadays as computers improve (or if you have a MAC) I owe the makers a big thank you for saving me from tearing my hair out in frustration over the years! Thanks guys! And if you are still having issues hopefully those other tips will help you on your road to a lag-free recording studio! Of course many interfaces need a driver usually to add functions or set bit depth or sample rate. Also there may be something that won't work but I would say that anything built in the last five years will work seamlessly with core audio. May 10, 2007 5:59 AM Reply Helpful Thread reply - more options There are many options available for desktop publishing software, and many of them, though very powerful, also come with a hefty price tag. If you're looking to do some desktop publishing of your own, but you don't want to go all-in on an expensive commercial piece of software, there are great options available on the Mac for free. Apple's Pages, which ships on all Macs, is a powerful word processor that can be used as document publishing program. If you need basic business documents, envelopes and business cards, this program can handle them easily. Pages comes with a selection of templates that help you create professional looking documents easy and in a short period of time. You can also work from a blank page, add fonts, personalize text styles, and add graphics and photos to design your document. Pages exports to PDF and Microsoft Word formats, and imports Word documents. Scribus is open source desktop publishing software that is available for several platforms, including Mac. Scribus offers CMYK color model support, font embedding and sub-setting, PDF creation, EPS import/export, basic drawing tools, and other professional level features. Scribus works in a fashion similar to Adobe InDesign and QuarkXPress with text frames, floating palettes, pull-down menus and has the features of the pro packages—but without the hefty price tag. However, Scribus may not be the best choice if you don't have the time or interest to devote to overcoming the learning curve associated with high-end professional level software. OpenOffice offers fully-integrated word processing, spreadsheet, presentation, drawing and database tools in an open source software suite. Among the many features, you'll find PDF and SWF (Flash) export, increased Microsoft Office format support and multiple languages. If your desktop publishing needs are basic but you also want a full suite of office tools, try Apache OpenOffice Productivity Suite. However, for more complex desktop publishing tasks you might be better off with Scribus or one of the print creativity titles for the Mac. Publisher Lite from PearlMountain Technology is a free desktop publishing and page layout application for business and home use. Available on the Mac App Store, this free software comes with more than 45 professional templates and hundreds of clipart images and backgrounds. Additional templates for brochures, flyers, newsletters, posters, business cards, invitations, and menus are offered as in-app purchases at an affordable \$0.99 each. Inkscape is a popular free, open source vector drawing program. It uses the scalable vector graphics (SVG) file format. Use it for creating text and graphics compositions including business cards, book covers, flyers and ads. Inkscape is similar in capabilities to Adobe Illustrator and CorelDraw. Although it is a graphic software program, it's quite capable of handling some page layout tasks. Thanks for letting us know! Tell us why!
