A programmer developed a plugin for the music player Foobar2000 to display information on a VFD screen connected via USB. The plugin, named "foo_usbhid_m202md28a," can display dynamic information such as playback time, frequency spectrum, and volume levels in real-time. The programmer explains that the plugin's primary purpose was to learn C++ programming skills. However, after experimenting with the plugin, they discovered that it could be easily modified to output data via a serial interface instead of USB HID. This would allow for greater flexibility in customizing the display settings and improving its functionality. To install the plugin, users need to download the DLL file and place it in the Foobar2000 components directory. The plugin can then be configured through the settings page to customize its behavior and appearance. Users can also reset the plugin's settings to their default values if needed. The programmer provides detailed instructions for customizing various aspects of the plugin, including: 1. Displaying dynamic information such as playback time and frequency spectrum. 2. Customizing the display layout and font styles. 3. Configuring the serial interface output (if desired). 4. Setting up power control options (e.g., brightness, power-off timing). 5. Adjusting scroll speed and delay settings. Additionally, the programmer addresses potential issues with the plugin, such as USB data reception problems that may cause flickering pixels on the screen. They suggest possible solutions to these issues. Lastly, they provide instructions for compiling the plugin in Visual Studio 2019, including a workaround for resolving compatibility issues between VS 2019 and earlier versions of the software.
