**1956 - 1960 Riding lawn mower****Western Tool built Production Distributor****Craftsman (a part of Sears) Manufacturer****Western Tool Riding lawn mower Built in Des Moines, Iowa, USA****Original price was \$300 in 1956** Information on this riding mower is limited. A two-cycle engine was used until 1958. Electric start and a new body appeared in 1959. Mechanical Two-wheel drive Manual steering Open operator station. Photos No photos of the Craftsman 536.8145 are currently available. To submit yours, email it to Peter@TractorData.com. Photos may only be used with the permission of the original photographer. 536.8145 Serial Numbers 1956536.81450 (model code) 1957536.81451 (model code) 1958536.81453 (model code) 1959536.81456 (model code) 1960536.81456 (model code) FAQ: How to read a serial number table. References Service - DCraftsman Riding Mowers and Engines (Div. 9 No. 12) published in 1959 Page information Copyright 2024 TractorData.com TractorData is a family-owned small business located in Minnesota that has been providing reference information on tractors since 1999. Peter Easterlund - owner/author Email: Peter@TractorData.com Updated on October 28, 2023 If you own a Sears Craftsman riding mower, you can determine which year it was manufactured by first finding the serial number. Serial numbers typically start with two letters that signify the month and year of manufacture (such as AJ for April/January). The remaining digits will indicate the production date. If you need additional help determining your mowers age, you can call Sears Customer Service (1-800-4-MY-HOME) and provide them with the model number and serial number.Once you have the year, you can then use that information to find manuals and parts which Sears can provide for your Craftsman riding mower.How can I tell how old my lawn mower is?To determine how old your lawn mower is, you'll want to consult your lawn mowers manual or serial number. The serial number should tell you the production year and make of the mower. Depending on the make and model of the mower, the number may be printed on the engine, under the body of the mower, or inside of the fuel tank.Once you've identified the make and model, you can contact the manufacturer to find out the age of the mower. Usually, the manufacturer will have records of all its models and be able to tell you the mowers age.If you can't find the serial number or the company is no longer in business, you may be able to determine the age of the mower by examining the design and technology of the mower.If it is an older model, it may have a manual pull start. A mower with an electric starter is likely to be newer than one with a manual start. Additionally, newer models may feature polypropylene or composite materials, while older models may have different painted metal frames.Ultimately, the only way to know the exact age of your mower is to consult the serial number or contact the manufacturer directly.What year is a Craftsman LT 1000?The Craftsman LT 1000 is a lawnmower model that was produced from 2006 to 2010. The exact year of production depends on the specific characteristics of the specific model. For example, the LT 1000 model 536.270911 was produced in 2007, while the LT 1000 model 917.272341 was produced in 2007 and again in 2009. The model number can usually be found on the underside of the mowers metal or plastic body, or under the seat.Additionally, additional information on finding and identifying the model number can be found in the owners manual of the mower.Where is the model number on a tractor?The model number on a tractor will usually be located on an identification or serial number decal. It can usually be found on the front doors, or the rear fender, of the tractor. The model number (also referred to as the product identification or serial number) is typically an alphanumeric code that may contain letters, numbers, and/or hyphens.It is often preceded by a manufacturer code or brand name. For example, the model number might begin with M-F-A-J for Massey Ferguson or CAT-237 for a Caterpillar model. In some cases, such as John Deere, the model number may be continued on another decal, or on the side of the hood or the rear of the fender.It is important to note that the model number on a tractor can vary from model to model, and from year to year, so identifying it can be a bit tricky. If you are having difficulty locating it, it is strongly recommended that you consult your tractors manual or contact the manufacturer for assistance.How do I identify my Craftsman riding mower?In order to identify your Craftsman riding mower, you will need to locate the model number located on the product identification tag, which is typically located on the underside of the mowers seat. Depending on the age of your mower, the tag may also be found on the back of the mower or near the engine.Additionally, you can look for the model number on the side of the mowers engine. Once you have identified the model number, you can use the Craftsman Customer Care website to find information and resources related to your mowers model and age.If you are unable to find the model number on your mower, you can select the appropriate Craftsman Mower Button on the website, which will provide a general overview and images of the main components of each Craftsman Mower.How do you read a Briggs and Stratton date code?Briggs and Stratton use a 7-digit code to identify when the engine was manufactured. To read this code, you must first know the individual digits represent. The first 3 digits represent the day of the year the engine was manufactured (1st day is 001 and the 365th day is 365).The next 3 digits represent the year, with the last digit indicating the decade. For example, the number 63775 would mean the engine was built on the 237th day of the year 1975. The last digit, 5, indicates the engine was built in the 1970s.This code can be found on the Engine Data plate which is usually found near the exhaust port.How do I read my MTD serial number?Reading your MTD serial number can be done in a few simple steps. First, locate the serial number sticker which can usually be found on the back of the machine or motor. If this is not available, search for the model and type numbers found on the frame of the machine or on the side of the motor.Once you have located the serial number, it should consist of 10 to 13 characters, including both letters and numbers. An example of a typical serial number can look like this: 1K052J30307. The first character is usually a letter or number which informs you of the origin or origin country of the serial number. The first two characters after the origin code usually correspond to the machines brand while the numbers following usually denote the model and year it was manufactured.The rest of the numbers are usually referred to as the referential code and /or the build date code. With the build date code, you will be able to determine the exact date the machine was assembled.It is important to note that sometimes serial numbers can be tricky to read, so it is important to take your time and meticulously inspect the serial number sticker or label to make sure you are reading it accurately.How do you read a Honda lawn mower serial number?Using the serial number to read a Honda lawn mower is an easy task. First, you need to locate the serial number which is typically located on a metal plate on the mower. It is usually found underneath the mowers seat, near the engine cover, or near the sidewall.The serial number will generally consist of 12 characters, including numbers and letters. It is important to remember that the serial number itself has no real meaning. It is used only as a reference number to identify your particular mower.Once you have located the serial number, you will need to break the number up into three sections in order to determine the date of the mower. The three sections are normally separated by a hyphen. The first four or five characters of the serial number will represent the month and year the mower was manufactured. The following four characters will represent the model number of the mower. The last three or four characters are usually the production code that represents the day of the month the mower was manufactured.Once you have broken down the serial number, you can read the Honda lawn mowers serial number and determine the month, year, and day that it was manufactured.How do you read a riding lawn mower, there are several steps to follow. First, you should familiarize yourself with all the parts of the lawn mower, in particular the controls and the safety features if available.After you are comfortable with the mower, position yourself in the drivers seat with your feet on the foot pedals and hands on the wheel.Then, locate the key and insert it in the ignition. Turn the key to the Start position, and hold the breaks until the engine starts. Most mowers take several tries to start, so dont give up! Once the engine is running, push the accelerator forward and press the clutch pedal with your left foot and the brake with your right foot to move the mower.As you drive your mower, watch out for obstacles in your path, hold onto the wheel at all times, and consistently maintain your speed. If you need to stop, press the clutch and brake simultaneously until the mower comes to a halt.To turn, press the same pedals and move the wheel in the direction you want to turn.Finally, when youre finished, turn off the mower by moving the key to the Off position and ensuring that the mower is in neutral.What setting should my riding lawn mower be on?The ideal setting for a riding lawn mower will depend on your terrain and existing grass height. Generally, you will want to be sure that your mower cutting blade is set low enough to efficiently cut through the grass.The lower the blade setting, the shorter the cut. Additionally, a lower setting will leave your lawn looking neat and tidy. However, if you set the blade too low, you may end up scalping the lawn, which can be damaging to the grass.On hilly terrain, it is important to take extra caution to ensure the blades are not set too low. The steeper the hills, the higher setting you should use to avoid scalping. On flatter terrain, you may find that you can use a lower setting.Additionally, if you are cutting a taller grass, you should use a higher setting to get a more even cut.Ultimately, it is best to experiment with different settings to get the best cut for your lawn. When in doubt, a good rule of thumb is to start with a moderate blade setting and adjust as needed. Its best to experiment with different settings to get the best cut for your lawn. When in doubt, a good rule of thumb is to start with a moderate blade setting and adjust as needed.Its better to cut grass high or low?The answer to this question ultimately depends on what type of lawn you have and what your personal preference is. Generally speaking, if you have cool-season grass, like Kentucky bluegrass or ryegrass, it is best to cut the grass high (2.5 to 3 inches) because it reduces the potential for weed germination, encourages rooting, and helps keep the grass thick. On the other hand, if you have warm-season grasses like Bermuda or zoysia, it is generally recommended to cut those about 1.5 inches to 2 inches, as these grasses normally have a more open-growth habit.Additionally, for both cool- and warm-season grasses, the quality of the cut plays a role. If it is too low, it will result in a shorter, weaker root system. If its too high, sun damage and fungal diseases may occur.Ultimately, it is best to customize the height of your lawn mowers cutting blades based on the weather conditions and the appearance you prefer. It may require a few adjustments, but if youre patient and consistent, you should be able to find the right balance between quality and aesthetics.Should I cut my grass at 3 inches?Yes, you should cut your grass at 3 inches for a healthy-looking lawn. This length helps to crowd out weeds, retain soil moisture, and protect grass roots. It will also encourage a deeper root system and healthier grass blades.Mowing at 3 inches helps to prevent many problems, including disease and insect infestations. The taller grass also shades out weed germination, so fewer weeds sprout. Additionally, allowing your grass to grow to the 3-inch height before mowing helps to reduce the chance of scalping and cutting the grass too short.When you mow the grass at 3 inches, make sure you use sharp blades to get a clean, even cut.What height should grass be cut in summer?The ideal grass height for summer depends on the type of grass you are growing and your climate. Generally, warm season grasses, such as Bermuda, can be cut lower than cool season grasses, such as fescue.In hot areas, warm season grasses should be kept between 1-2 million. Cool season grasses should be kept between 2-3 million. To keep the grass healthy and lush, the blades should never be cut lower than the recommended height.In periods of extreme heat or drought, it is best to raise the cutting height to 3 million to help reduce stress on the lawn. Additionally, grass should be cut regularly (about once every 7-10 days) and never more than 1/3 of the total blade height should be removed in any single mowing.How short should I cut my grass?The ideal height to mow your grass depends largely on the type of grass that you have. Different types of grass have different recommended heights, as cutting them too short can cause damage and inconsistent growth.Different types of grass can also respond differently to the same mowing height, making finding the right height more of an experiment.For Kentucky Bluegrass, a common grass type in American lawns, a good standard to use is to mow the grass between 2-3 inches high. This height will help the grass to maintain healthy growth and will provide the best looks for your lawn.Of course, you may have to experiment to find the best height for your individual lawn. In general, any grass should not be mowed lower than 2 inches as this height can cause damage to the grass.In terms of frequency, you should mow your grass once a week, but only remove one third of the grass blade. Removing more than one third can shock the grass and make it harder for it to recover. Always keep an eye on your lawn and adjust the mowing height and frequency as needed.How do you measure mower cutting height?Measuring mower cutting height accurately is important for achieving a good lawn finish. To measure mower cutting height, you should adjust the mowers deck height to the desired level, then measure from the ground to the bottom of the mower once it is at rest.For safety, you should use a measuring device that allows you to measure the height from a distance and without having to kneel down next to the mower. It is also important to make sure that the mower is at rest, so that any uneven ground does not cause the mower to be higher or lower than the intended height.Before measuring, you should ensure that all loose debris or obstructions are removed from the area, and be aware of any objects that could reduce the accuracy of the measurement. Once adequately measured, the height of the mowers deck can be adjusted accordingly.What are the numbers on lawn mower?The numbers on a lawn mower typically refer to the model and serial numbers of the mower. The serial number can usually be found near the engine, which is the small motor that powers the mower. The model number can often be found on a tag attached to the mower, usually near the handle.Having these numbers on hand can be useful for ordering parts, accessing warranty information, and other purposes.How do I find the model of my riding lawn mower?One of the best ways to determine the model of your riding lawn mower is by looking at the Serial Number. This will usually be visible on the frame of the mower and is normally accompanied by the manufacturer name.If the serial number is not visible, it may be found on the mowers engine block or underneath the mowers seat. Serial numbers are typically a series of five digits, followed by a dash, and then a series of four digits.If available, you can also check the owners manual or instruction booklet that came with the mower. This should provide you with the exact model number. Typically, the model number will either be located at the top or bottom of the front page, or in the table of contents.If you do not have any of these resources, go to the manufacturers website. Most manufacturers, such as Briggs & Stratton or Toro, provide websites where you can enter the serial number or key words to search for the model number.Other resources include reviewing any registration information you may have for the mower, determining the age of the mower by researching past recalls, or consulting a lawn and garden expert who can help you further.Where do you find model number?The model number on a product can usually be found on a label or sticker near the bottom or back of the item. It may also be printed on a warranty card or further inside the product manual. The model number can vary in appearance depending on the type of product.For example, it may be labeled as Model, M/N, Part Number, PN, or SKU. Some products may have multiple model numbers. If you are looking up a specific model number online, you may need all available numbers in order to find the proper information.How do I find the model and serial number on a riding lawn tractor Husqvarna?If you are trying to find the model and serial number on your Husqvarna riding lawn tractor, you can do so in a few different ways. First, look for decals or small plates on your mower that includes the product identification information. Depending on the age of the tractor, this information may be located on the front of the mower behind the hood, on the base of the seat, or on the side of the frame near the rear wheel. Additionally, check the owners manual for the model and serial number as the information is usually included in the manual.Finally, you can also look online. Visit the Husqvarna website or contact Husqvarna customer service who may be able to provide the model and serial number based on the tractors make and year. Average Rating:Performance:Reliability:Safety:Overall Satisfaction:The Craftsman LT1000 garden tractor lawn mower is often known by its serial number, the Craftsman 27639. Both refer to the same tractor mower. The engine powering the LT 1000 is an Intek model from Briggs and Stratton. This is a two stroke, 1 cylinder model that pumps out 18 hp. The cylinder in this Briggs and Stratton engine has a cast iron cylinder sleeve for an extra long operating life. The engine stay oiled thanks to a fully pressurized lubrication system.This engine on the Craftsman LT1000 powers the mower deck and the wheels. The mowing deck has a cutting width of 42 inches (its total width is a good bit higher than this due to the plastic discharge flap on the side). Inside the deck are 2 blades working together to give a nice smooth, even cut to your lawn. The deck has an operating range of 2.5 inches, from a low of 1.5 inches above the ground to a high of 4 inches above the ground. For dealing with the cut grass clippings, you have 3 choices. Many people just leave the grass clippings to fly out the side of the deck and lay on the grass. Unfortunately this can prove to be rather unsightly, so what some people do is purchase a bagger to collect them or use a mulching kit to turn them into a fast rotting mulch.Power to the wheels on the Craftsman LT1000 is controlled by a gear shift transmission. This gives the operator 6 different speeds going forwards, while in reverse they just have one speed. The fuel tank that supplies the engine with gasoline can hold up to 4.7 liters (1.25 US gallons). If you have ever owned or operated the LT 1000 garden tractor lawnmower, then please feel free to leave a review of it below, making sure to mention what you like and dislike about it.Return to Craftsman from Craftsman LT1000 Garden Tractor Lawn MowerCraftsman LT10003.82560Have Your Say!
